PROJECT
Airline Reservation & Flight Booking System

DATABASE
MySQL 8.0 · `airline_reservation`

SUBMITTED
25 October 2026

Aim

To insert realistic sample data into all nine tables of the airline reservation database, enough to simulate a working airline, while satisfying every key, CHECK constraint and trigger from Assignments 5 and 6.

1. The Scenario

The data describes **SkyWings**, a fictitious airline based at Hyderabad (HYD), as it stood on **25 October 2026 at 14:00 IST**:

- **Network.** 11 real airports: nine in India plus Dubai and Singapore. There are 16 routes (SW101–SW901), mostly out of Hyderabad, and the main domestic routes also have a return flight.
- **Fleet.** 7 aircraft: A320neo, A321neo, Boeing 737-8, an ATR 72-600 for the short Visakhapatnam hop, and a Boeing 787-9 with all four cabins for Dubai and Singapore. One A320neo is in maintenance.
- **Schedule.** 92 dated flights between 26 September and 6 November 2026, with base prices from ₹2,910 to ₹14,290 depending on distance and date. 61 flights have arrived, 28 are scheduled, one is delayed (SW102 on 26 October), and two SW651 flights to Kochi were cancelled.
- **Passengers.** 46 passengers: seven families and 25 individual travellers, including four foreign nationals. Three are registered but have never booked.
- **Bookings.** 175 bookings (PNRs) made between 28 July and 25 October. 45 of them are for several travellers, such as a family flying together, and 22 are round trips. 155 are confirmed, 16 cancelled (including every booking on the two cancelled flights) and 4 are still waiting for payment.
- **Tickets.** 310 tickets in Economy, Premium Economy, Business and First. On past flights travellers boarded or were no-shows. For the next two days some have already checked in.
- **Payments.** 199 payment attempts. 20 bookings had a failed card attempt before a successful payment, cancelled bookings were refunded, and pending bookings have a pending (sometimes previously failed) attempt. Every successful payment equals the booking's total fare.
- **Fictitious data.** The airline, its flight numbers and aircraft registrations are invented. Passenger names, phone numbers, e-mails (example.com) and passport numbers are invented. Airports are real.

11 airports	**7** aircraft	**4** travel classes	**16** routes
92 flights	**46** passengers	**175** bookings	**310** tickets
199 payments	**860** rows in total		

2. Loading Order

Rows are inserted in the order the events happen. Flights are published first, all as *Scheduled*, because the ticket trigger only sells seats on flights that are open. Bookings, tickets and payments follow. Finally the operational status of each flight is updated. Cancelling the two SW651 flights fires `trg_flight_after_update`, which cancels their tickets automatically.

#	Statement	Checked by
1–4	INSERT airports, aircraft, travel_classes, routes	PKs, UNIQUE registration / flight number, CHECK codes, seats, origin ≠ destination
5	INSERT flights (Scheduled)	FKs to routes and aircraft, one flight per route per day, arrival > departure
6	INSERT passengers	UNIQUE e-mail and (nationality, passport), CHECK formats
7	INSERT bookings	FK passenger, UNIQUE PNR
8	INSERT ticket_details	4 FKs, unique live seat and traveller per flight, cabin capacity trigger
9	INSERT payments	FK booking, one successful payment, unique transaction ref, payment trigger
10	UPDATE flights (Arrived / Delayed / Cancelled)	ENUM status; cancellation trigger

3. Execution

Each statement was executed in order. Only the first two rows of each INSERT are reproduced here; the full script is in the appendix and in `sql/04_sample_data.sql`.

1. airports (11 rows)

MySQL 8.0 Command Line Client — airline_reservation

```
mysql> INSERT INTO airports (airport_code, airport_name, city, country) VALUES

Result

All 860 rows were loaded without errors or warnings, so the data satisfies every constraint and trigger. The business-rule checks find no violations: every confirmed booking is fully paid, every fare matches its flight and class, no cabin is oversold, and no live ticket remains on a cancelled flight. The data covers the situations an airline deals with: families and round trips, failed and retried payments, cancellations and refunds, no-shows, delays, and passengers who have not booked yet. These give the queries of Assignments 8 and 9 meaningful results.
